· Information on likely routes of exposure

CAS 6283-63-2 4-Amino-N,N-diethylaniline sulfate:

In analogy to CAS 93-05-0 Amino-N,N-diethylaniline at workplaces the main route of exposure is via the respiratory tract and the skin.

"The high systemic potential of Amino-N,N-diethylaniline observed in animal experiments after oral application of relatively low doses permits the assumption of an effective resorption via the digestive tract that must also be assumed for humans." [GESTIS]
The intake of sulfuric acid is mainly to be expected via the inhalative pathway in the form of aerosols. No studies on absorbability are available.

Generally, local reactions cause the main effects.

Following impact to the skin strong local effects are the main issue. There is no indication of absorption of relevant amounts of S. via the intact skin.

Absorbability via the gastrointestinal tract is assumed. However, no studies on the kinetics of uptake are available. [GESTIS]

· Additional toxicological information:

Vapours and aerosols may be irritant to the mucous membranes and upper respiratory tract.

CAS: 7664-93-9 sulphuric acid	
·	(source: GESTIS) Main toxic effects Acute: Irritation up to chemical burns to the mucous membranes and skin, danger of serious damage to the eyes and lungs Chronic: Irritation to the eyes and airways, erosion of the teeth, damage to the skin Further Information: Concentrated S. differs considerably from dilute Sulfuric acid with regard to chemical properties and effects. With increased dilution Sulfuric acid acts less aggressively.
CAS: 6283-63-2 N,N-diethylbenzene-1,4-diammonium sulphate (1:1)	
·	(source: GESTIS) Main toxic effects of CAS 93-05-0 4-Amino-N,N-diethylaniline: Acute: Irritative effects to the mucosae and the skin, sensitising effects; Chronic: Skin diseases. Only insufficient information available on the systemic effects.
