

Lovibond® Water Testing

Tintometer® Group

Welcome!

We are excited to be able to present our latest newsletter to you. This first version not only gives you a brief overview of the latest edition of our catalogues and brochures but also highlights our new quality- and analysis certificates. Enjoy reading it!

At the end of this mail you will find a link to adjust your profile and personal settings. We invite you to use this opportunity to ensure you receive the contents you are looking for.

Best wishes from Dortmund

All around the pool - latest edition of our pool catalogue and brochure now available

“It’s all for the pool“ - this is our central motto for the latest edition of our catalogue and the complementing brochures. Clean water is not only essential to life but also for pools and spas. We compiled lots of useful topics and information worth knowing and that answer questions like "pool" over "maintenance" to "treatment". We would especially like to highlight innovative new products, such as:

- The new photometer PM 630 with Bluetooth® (available from May 2015)
- Information around the datamanagement app AquaLX® (available from May 2015)
- The revised design of the Pooltesters

We wish you a happy and successful season 2015 and are looking forward to a continued series of success stories. You can find the new edition of our catalogue [online](#) or order it by contacting our sales team.

New certificates

New certificates for COD and chlorine available

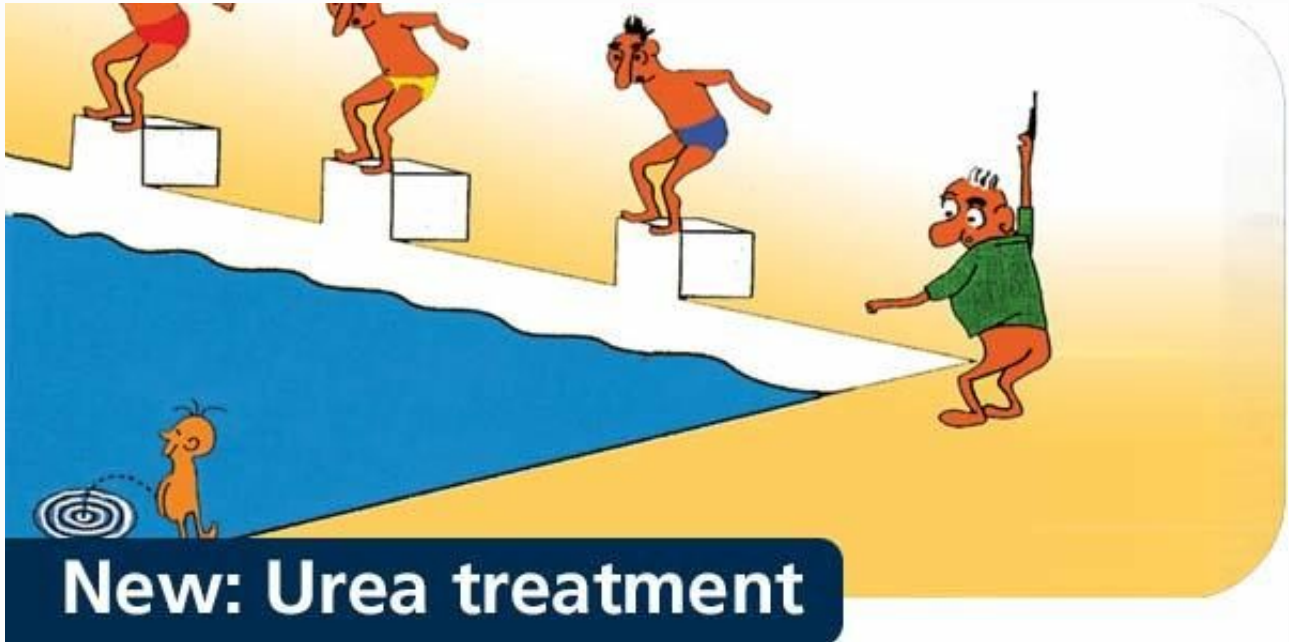

We are currently working on the certificates for all available reagents. From now onwards we will be identifying the differences between quality certificates and analysis certificates. While the first describe the used methods and techniques, the latter explains details about the relevant product lot(s). Batch-codes printed on each package serve as identification for the relevant document. They can be found [here](#).

We continuously complement and modify this list. As soon as new certificates are available we will notify you in future newsletters. These certificates are part of our quality control procedure; hence, we added descriptions on experimental arrangements and test settings.

Our technical support is ready to help you with any questions.

New: UREA PRETREAT tablet

We strongly recommend measuring the urea load continuously (NHCO) in order to determine the ideal point of action for treatments. The presence of free chlorine (HOCl) does, indeed, tend to disturb the urea measurement. Adding a UREA PRETREAT tablet prior to the measurement eliminates up to 2 mg/l free chlorine from the water sample. A higher concentration of free chlorine requires adding a correlating number of tablets. This guarantees a valid result in the following urea-load-test.

Please go to website to find the relevant instruction material.

Corporate position on conflict materials

Even though Tintometer® is a non-listed and family operated business we feel obliged to adhere to ethical and moral standards and therefore follow the guidelines of the Dodd-Frank-Act. These regulations bind stock-listed companies in the US, and therewith directly and indirectly with their suppliers, to reveal their use of the so-called conflict materials from crisis- or war areas. We would like to take the opportunity to explain our corporate position by a [prepared statement](#) on the use of these conflict materials inside the Tintometer® Group.

Please contact us for any questions or comments.
